PROFESSIONAL STATEMENT

GOVERNANCE, RISK & COMPLIANCE FOCUS · COMMUNITY TECH AID

NAME	FOCUS AREAS	LOCATION
Kelly Guzman	**Governance, Risk & Compliance · NIST 800-53 · CMMC · PCI DSS**	**Hayden, ID · Spokane-Coeur d'Alene Area**

Statement

> *I approach cybersecurity from the governance, risk, and compliance side, bringing hands-on IT and federal field operations to the work of keeping systems secure, documented, and audit-ready. My background is defined by high-stakes, highly regulated deployments, including election security, secure federal hardware rollouts, and PCI-compliant environments, where chain of custody and operational integrity are non-negotiable. I am driven to protect the people behind the systems and to hold organizations accountable to the standards they claim to uphold, with a focused interest in NIST 800-53, CMMC, and practical, repeatable security controls.*

Extended statement

I am an IT and security professional focused on governance, risk, and compliance (GRC), with hands-on experience across federal operations, enterprise retail environments, and direct client support. My strengths are systematic troubleshooting honed through years of field work, clear communication with non-technical stakeholders, and documentation rigor that holds up under scrutiny. As a paid Chief Polling Judge in Kootenai County, Idaho, I secured digital voting tablets and maintained chain of custody for ballots and sensitive materials under strict legal compliance. I have executed compliant federal hardware rollouts, including secure USPS handheld upgrades and verifications across facilities in Spokane, Washington and Idaho. I have built and hardened public-facing platforms using Zero Trust principles, managed secure DNS through Cloudflare, and triaged social-engineering risks. Through founding Community Tech Aid, I have built a practice around scam prevention and tech literacy for seniors, veterans, and underserved communities in North Idaho. I bring the same persistence and attention to detail to compliance work: mapping controls, documenting evidence, and making sure the people who depend on secure systems are never an afterthought. I am seeking GRC and compliance roles where a federal field background, framework literacy across NIST 800-53, CMMC, and PCI DSS, and investigative instincts are relevant, not decorative.

Strengths

- **Documentation and audit-ready evidence.** Forensic-level record keeping and procedural persistence demonstrated across complex, multi-agency engagements. In GRC, that discipline is the job, not a nicety.
- **Framework-aligned security controls.** Hands-on PCI-compliant retail rollouts and secure federal deployments, with working literacy in the NIST 800-53 and CMMC control families.
- **Clear risk communication.** Community Tech Aid exists because I can translate technical risk for non-technical people. That same skill turns audit findings into decisions leadership will act on.

Values

- **Protecting vulnerable populations.** The Community Tech Aid model is built on this principle: scam prevention, tech literacy, and advocacy for people who get overlooked.
- **Integrity and accountability in systems.** I hold institutions to their own standards. That is the same instinct that drives good compliance and risk work.

Career direction

Cybersecurity focus: Governance, risk, and compliance: control mapping, security documentation, and audit readiness, with working knowledge of NIST 800-53, CMMC, and PCI DSS. I think in systems and feedback loops, and I want to be the one making sure the controls actually hold.

Target audience: Cybersecurity recruiters, government contractors, and mission-driven organizations. I am building toward GRC and compliance roles where my federal experience and field operations background are relevant, not decorative.

Value alignment: Organizations need people who document relentlessly, communicate clearly under pressure, and do not flinch when the trail gets complicated. My background in federal field operations, election security, PCI-compliant retail rollouts, and direct client triage means I have already been doing the unglamorous core of compliance work: protecting systems, the standards behind them, and the people who depend on them.
