Operational environment

The bank is located in a coastal area with low crime rates. Many people and systems handle the bank's data: 100 on-premise employees and 20 remote employees. The customer base of the bank includes 2,000 individual accounts and 200 commercial accounts. The bank's services are marketed by a professional sports team and ten local businesses in the community. There are strict financial regulations that require the bank to secure their data and funds, like having enough cash available each day to meet Federal Reserve requirements.

Risk register

ASSET	RISK	DESCRIPTION	LIKELY	SEVERE	PRIORITY
Funds	Business email compromise	An employee is tricked into sharing confidential information.	**3**	**3**	**9**
	Compromised user database	Customer data is poorly encrypted.	**2**	**3**	**6**
	Financial records leak	A database server of backed up data is publicly accessible.	**3**	**3**	**9**
	Theft	The bank's safe is left unlocked.	**2**	**2**	**4**
	Supply chain disruption	Delivery delays due to natural disasters.	**1**	**2**	**2**

Notes

Supply chain disruption due to a natural disaster could happen with a hurricane for example,

but the likelihood of this event occurring annually in the same spot is unlikely. However, it could happen several years apart, making this likelihood the least likely, and again, FDIC and/or insurance could cover losses, which is better than taking a reputational hit due to carelessness or a breach.

The bank's safe being left unlocked is an active control failure. With 120 employees plus customers moving through the building, the likelihood of opportunistic theft is moderate. Severity is moderate because FDIC insurance covers depositor funds, but the bank still absorbs reputational damage and regulatory scrutiny.

Given today's treacherous hacker landscape, any publicly available data is vulnerable, let alone publicly available for anyone to grab at any time. This poses a likelihood this data is compromised and/or stolen from plain sight.

Customer data is encrypted albeit poorly. This presents some form of layered protection, but at the hands of a driven threat actor or careless data management, this could pose a severe risk to operations and customer data, and therefore compromise customers and the bank's reputation. Therefore the likelihood this data could be compromised is a medium level.

Unfortunately, human error is the most likely cause of compromises, and social engineering in today's world poses an exponential risk above all else. Therefore the likelihood of this is placed at the highest level, plus the compromise could affect operations, clients, and the bank and/or the bank's reputation across the board.

Methodology

Each risk was scored using the standard formula `Likelihood × Severity = Priority`, with both inputs on a 1-3 scale. Likelihood reflects the potential frequency of the risk occurring, evaluated against whether it could plausibly happen daily, monthly, or annually. Severity reflects the potential consequences: financial harm to the bank and its customers, operational disruption, regulatory violation, and reputational damage. Priority scores range from 1 (low) to 9 (high) and indicate how quickly each risk should be addressed.

Risk matrix

LIKELIHOOD ↓ / SEVERITY →	LOW (1)	MODERATE (2)	CATASTROPHIC (3)
CERTAIN (3)	3	6	9
LIKELY (2)	2	4	6

RARE (1)	**1**	**2**	**3**
