SEC-RUNBOOK-01: Local AI Infrastructure & Security Ledger

FINAL

Author: Cybersecurity Admin (Kelly Guzman)
Classification: RESTRICTED - LOCAL INTERNAL ONLY
Target Environment: Local Workstation Engine

---

1. Environment Baseline & Socket Configuration

- **Hosting Node:** Local Administrative Workstation
- **Host OS:** Windows (PowerShell Shell Environment)
- **Processing Core:** Ollama Engine (Version 0.31.1+) [2026 Baseline]
- **Assigned Port:** 127.0.0.1:11434 (Internal Loopback Interface Only)

1.1 Network Cross-Origin Policy (CORS) Exemption

To allow local browser extensions to communicate securely with the internal socket layer without routing through public cloud relays, the engine is explicitly pinned to a custom origin wildcard:

- **Active Command:** `$env: OLLAMA_ORIGINS="*"; ollama serve`
- **Verified Endpoint Scope:** `[chrome-extension://* http://localhost https://localhost ...]`

---

2. Core Model Architecture Ledger

The following localized weights are extracted and mapped into the local filesystem matrix (C:\Users\ebizmarket.net\.ollama\models). Zero external telemetry is permitted.

Model Name	Parameters	Core Allocation	Use Case Scope
Llama 3.1	8B	Meta Instruct	Private Personal Admin (SBA, Medical, Financial Vectors)
Llama 3.2	3B / 1B	Meta Light	Rapid Inline Browser Management / Proton Mail Context Parsing

---

3. Storage Matrix & Local RAG Protocols

- **Data Ingestion Vector:** Open WebUI Offline Vector Store
- **Privacy Guardrail:** Files are parsed into local chunk profiles. No public telemetry or fine-tuning pipelines are shared outside the physical hard drive bounds.
- **Ingestion Pipeline Targets:** Localized business operational documents, custom administrative workflows, and historical session logs.

---

4. Cyber Training & Lab Sandbox Logs

4.1 Python Automation Log July 2, 2026

```
import requests def verify_local_ai_infrastructure(): url =
"http://127.0.0.1:11434/api/tags" headers = {"Origin": "chrome-
extension://"} print("[] Initiating localized
handshake...") try: response = requests.get(url, headers=headers,
timeout=5) if response.status_code == 200: print("[+] Handshake
SUCCESS: Local socket is operational.") else: print(f"[-] Handshake
FAILED: Status {response.status_code}") except
requests.exceptions.ConnectionError: print("[-] Connection CRITICAL:
Socket 11434 unreachable.") if name ==
"main": verify_local_ai_infrastructure()
```

4.2 Network Topology & Port Bindings

[Local Machine Client Layer] —> [Port 11434 Loopback] —> [Ollama Local Processing Matrix]

- **Hardened Binding Rule:** The core processing engine is strictly pinned via `$env: OLLAMA_ORIGINS="*"` to lock down the endpoint scope."
- **Privacy Guardrail:** Completely isolates sensitive user administration tasks inside the physical hard drive bounds (C:\Users\ebizmarket.net\.ollama\models). Zero external telemetry is permitted.
